"FLUX LIGHTING has been a French manufacturer of outdoor LED lighting equipment since 1993. The company designs, manufactures and markets high-quality luminaires using the "EASY LIGHT" philosophy: easy to install and easy to use."

FLUX LIGHTING handles the mechanical and electronic design and the development of all lighting products and manufactures them in-house, a guarantee of reliability and rapid adaptation to the market.

FOCUS ON:

- Use of the latest LED technologies.
- Light sources with high efficiency and high spectral quality.
- Development of innovative lighting solutions which are environmentally friendly.
- Optimum use of light thanks to efficient lenses.
- Continuous improvement and quality control.

FLUX creates innovative lighting management systems and offers a complete range of outdoor LED products: street luminaires, linear luminaires, floodlights and the DMX wireless system.

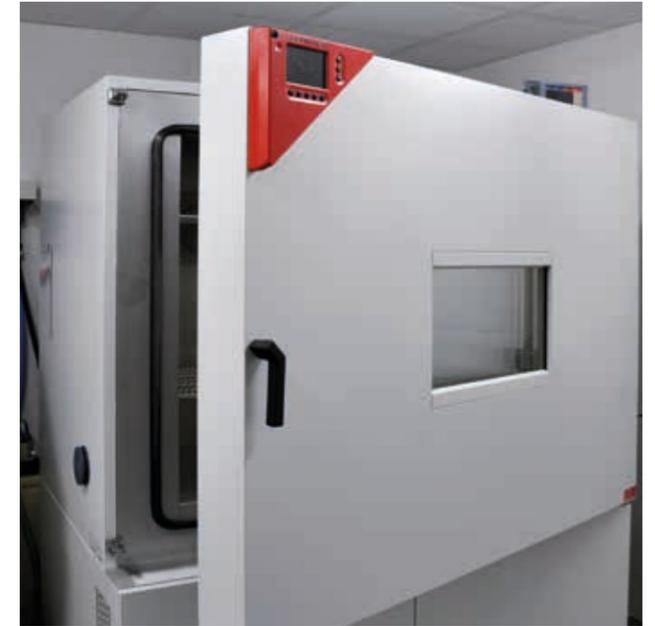

You will find our range of solutions for public lighting and illumination on our website: www.flux-lighting.com.

Imprimante 3D : Gain de temps pour le développement des produits.

Salt spray chamber

Climate chamber

Engineering & Design

Our own engineering department develops and designs all our products from start to finish using the EASY LIGHT philosophy.

Considerations

- Appropriate and minimal use of materials (e.g.: thermal calculations and simulations to optimize the thickness of aluminium heat sinks)
- Selection of the most appropriate materials
- Designs are intended to ensure easy recycling (no adhesives, recycling of some parts, optimized maintenance)
- Minimal energy consumption
- Manufacturing without generation of hazardous waste products in accordance with European standards (optimum sorting of waste)

Resources

The company has a test laboratory specially equipped to carry out testing: impact resistance (IK), sealing (IP), deformation and mechanical strength (press), thermal management (measurement software «Pyro Controle» Observer2), various electronic measurement devices: current consumed/current supplied.

Investments

To perform rigorous testing and to achieve technical excellence, the R&D department has a 3D printer for modelling mechanical parts, a salt spray test chamber, a climate chamber, a dust chamber, a UV ageing chamber and a thermal imaging camera.

Zhaga connector

Definition

Zhaga is a worldwide lighting industry organization that standardizes the components of LED luminaires (e.g.: C.O.B "Chip On Board"). This simplifies the design and manufacture of luminaires and accelerates the adoption of LED lighting solutions.

Zhaga LED module, Zhaga DALI driver and Zhaga connector are available at various suppliers

Standard Zhaga-D4i driver for luminaire with Zhaga connector

All FLUX street luminaires are equipped with a Zhaga-D4i driver when there are Zhaga connector.

A easy solution that makes it possible to add a sensor or wireless communication modules to the luminaires.

Zhaga Book 18 connector

The connector can receive and transmit a great amount of data.

DALI-2 bus feature

A bidirectional interaction is enabled between the sensor and/or communication module and the driver.

LED module non-proprietary

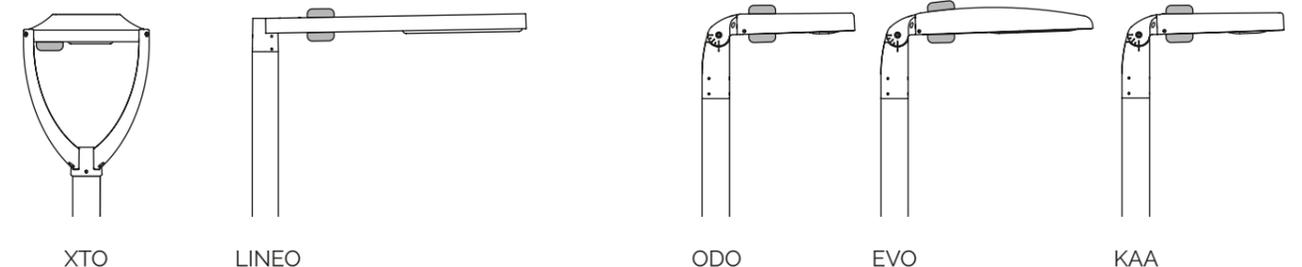

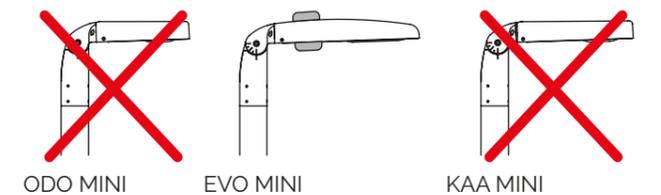

Zhaga COB modules are non-proprietary. Everyone is free to buy COBs from several suppliers.

- Standardized components, compatible and interchangeable with those of other suppliers.
- Ability to track changes, improved generation: diminished risk of obsolescence.
- Easy comparison of certain characteristics, dimensions are standardized.
- Lower development costs for luminaires meaning lower prices.

Zhaga Book 18 connector positions

For ODO, EVO, KAA, EVO MINI & LINEO, the Zhaga Book 18 connector can be placed on the top, at the bottom of the luminaire or both.

For XTO, Zhaga Book 18 connector may only be placed at the bottom.

Zhaga LED module.

Zhaga DALI driver integrated.

Zhaga Book 18 connector in option.

CLO (constant light output), AstroDIM, MainsDIM, StepDIM (p.134 to 137).

ULOR = 0%, no upward light emission.

Ultra-clear UV-resistant silicone lens, and no yellowing.

Class I, Class II optional.

Built-in lightning and surge protection 10 kV.

Delivered with a cable (p. 257).

Die-cast aluminium luminaire, with anti-corrosion treatment prior to polyester powder coating.

Integrated heat sink. Easy opening system using hinges.

Captive stainless steel fasteners with Delta Seal® galvanic tamperproof treatment.

Weight: 6.6 kg.

Windage: 0.045 m².

Maintenance: interchangeable LED module.

5-year warranty (see FLUX conditions).

Passive light effect without additional consumption.

Lighting management

Luminaire driver

Electronic power supplies designed to reduce energy costs using built-in functions, and to reduce maintenance costs thanks to a lifetime of 100,000 hours with a minimum 90% survival rate (for a Tcase from 67° C at ambient temperature of 30° C max., Tcase measured in the luminaire: 43° C at 25° C Ta), with built-in protection against lightning and surges, 8kV/6kV.

- Configurable par logiciel. Software-configurable.
- POWER FACTOR > 0.95.
- Available in Class I & Class II.
- Standards: CE, ENEC, VDE-EMC.

DALI integrated lighting management

Integrated Dali

The DALI protocol between a controller and the luminaires allows optimum management of lighting through a bus (2-wire) called the DALI line.

On, off and dimming are controlled via this line. Can be reprogrammed at the base of the pole.

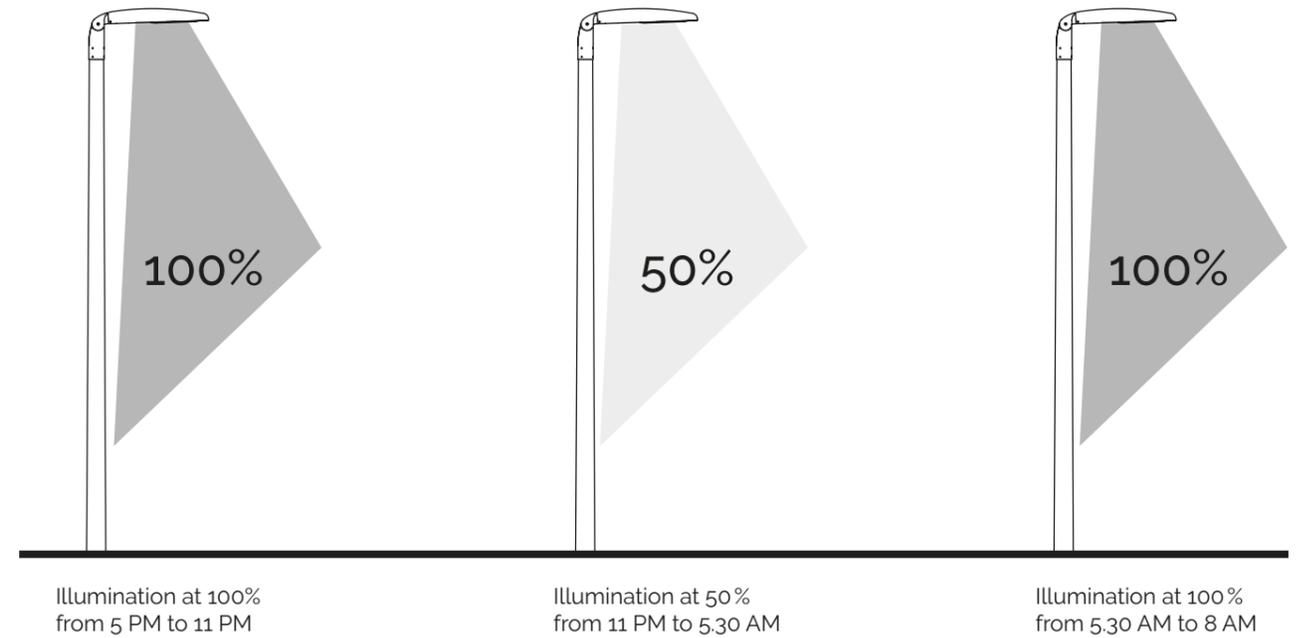

Public lighting

DALI drivers are fitted as standard in our street luminaires; the DALI can be connected to a centralised management system to benefit from feedback.

“AstroDIM”

Autonomous dimming

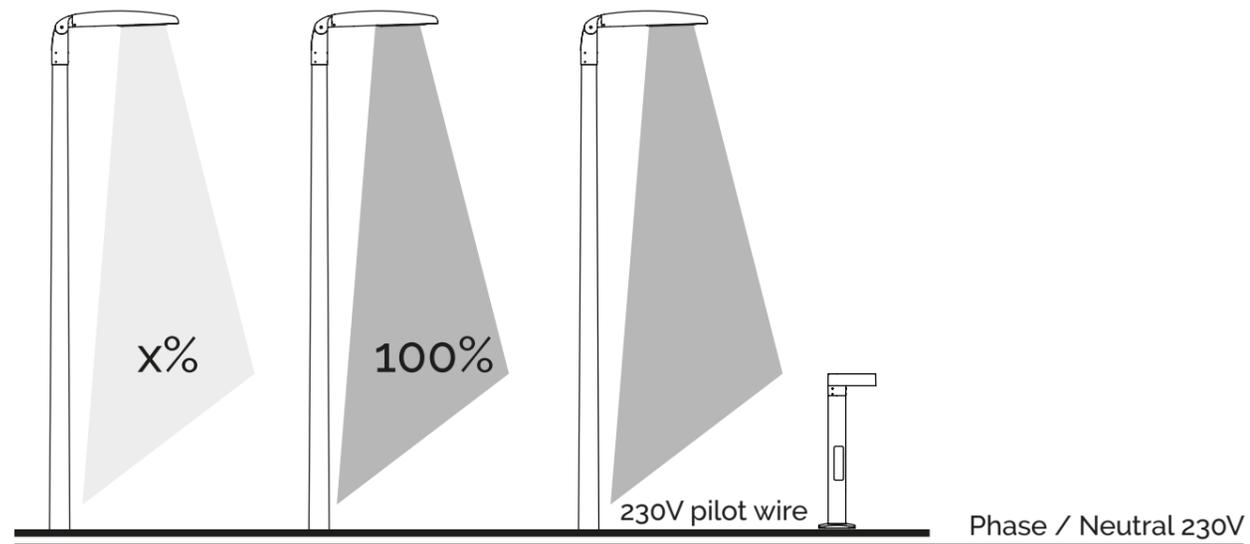

FLUX
LIGHTING

Autonomous dimming system with up to 5 different brightness thresholds. Energy savings without a costly system. Example: 100% brightness from 5 PM to 11 PM, 50% brightness from 11 PM to 5.30 AM, 100% brightness from 5.30 AM to 8 AM.

“StepDIM”

Phase control dimming

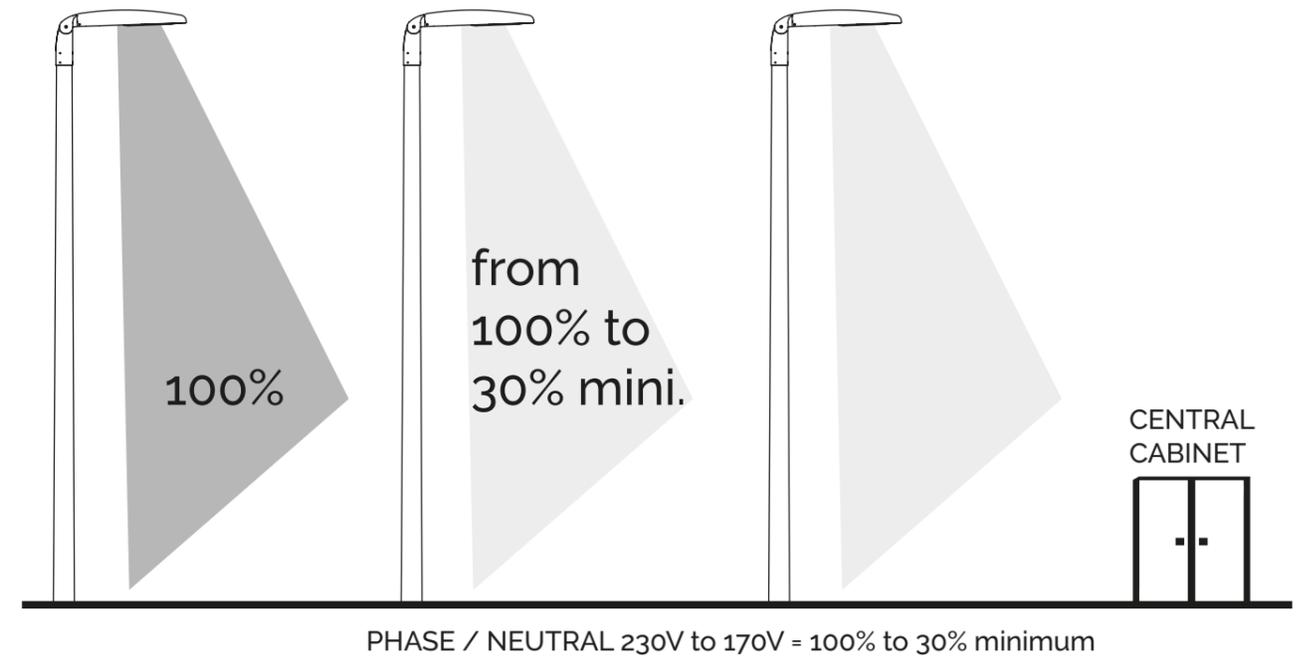

X = programming values from 0 to 100%

2 brightness thresholds set by a pilot wire depending on the presence or absence of 230 V power on this wire. Presence of this voltage can be managed by means of a presence detector, a dry contact, etc. Example: if 230 V is present on the pilot wire: 100% illumination or 230 V power cut on the pilot wire: 50% illumination.

“MainsDIM”

Network voltage dimming

Solution that controls the brightness of the LEDs according to the voltage of the PL (public lighting) network.

Standard configuration:

- Network voltage at 220 V > 100%
- Network voltage at 170 V > 70% dimming

Up to 70% savings! Controlled from the central cabinet.

DMX WIRELESS SYSTEM
Transmitter
(mm)

The Wireless DMX System is a wireless DMX/RDM control system for outdoor use.

IP66 DMX

The transmitter transmits a wireless DMX signal with or without RDM to several receivers. It uses all available channels of the 2.4 GHz HF frequency band. It receives digital signals from a DMX controller to convert them to radio signals.

Number of DMX networks: 1

Wireless transmission on the 2402-2480 MHz frequency band. Smart choice of frequency range: automatic allocation.

Range: 300 meters in unobstructed areas. The boxes are equipped with antennas that must be in plain view.

Full synchronisation, whatever the number of receivers.

Advanced 128-bit encryption protects against hackers.

Visualization software/configuration provided.

System under development. Information subject to change.

U.L.R.

Upward Light Ratio

U.L.R. (Upward Light Ratio) Proportion of the flux of a luminaire or installation that is emitted, at and above the horizontal, when the luminaire is mounted in its installed position.

95% of the luminous flux emitted from the luminaire in a cone of $2 \times 75.5^\circ$.

U.L.O.R. / D.L.O.R. / L.O.R.

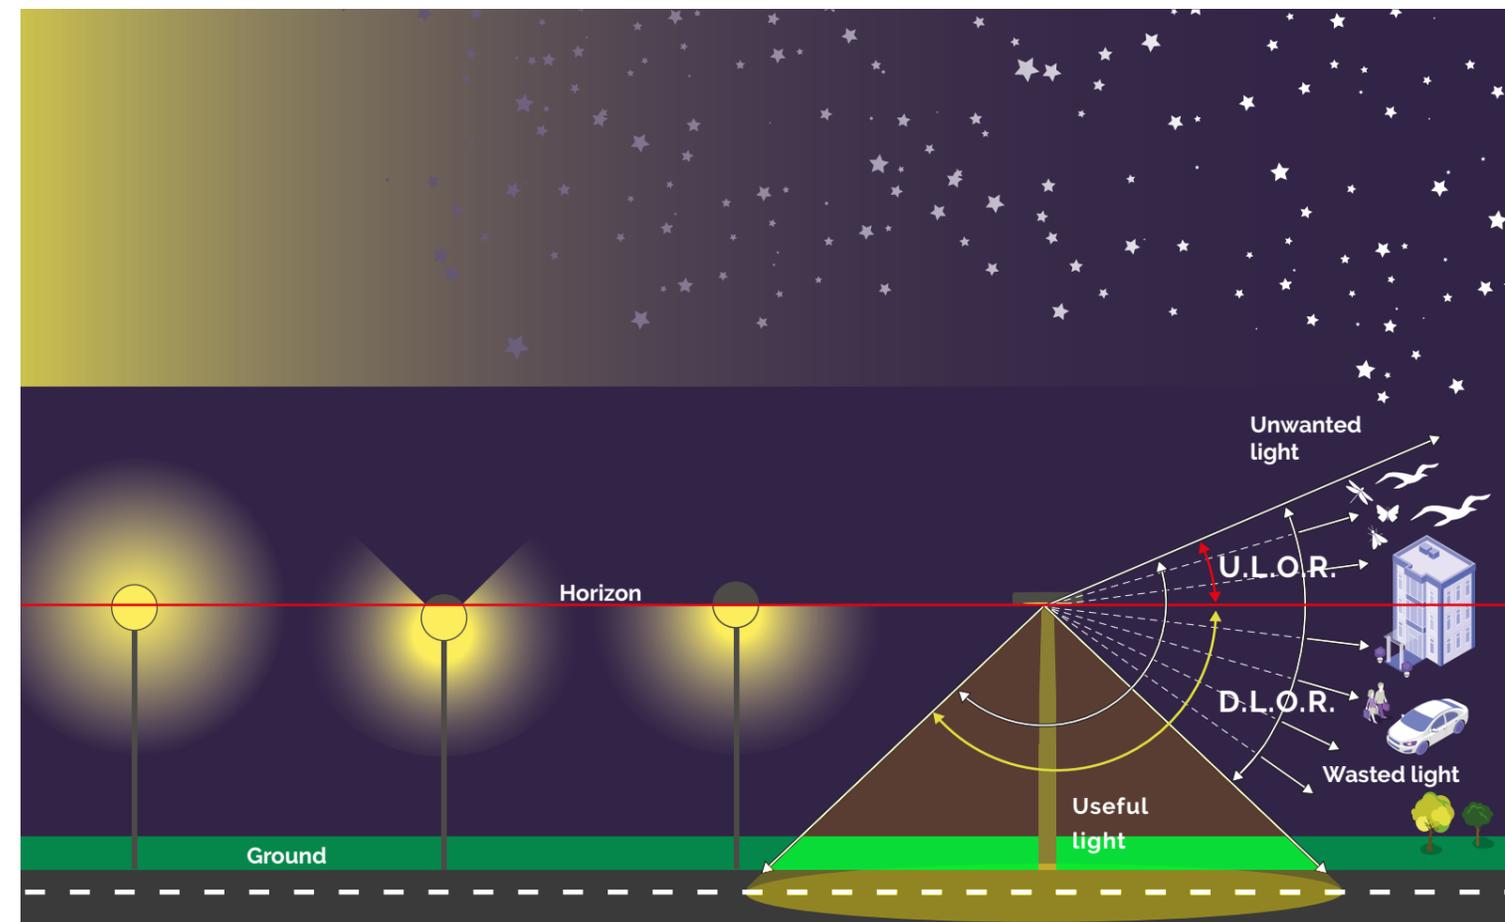

Distribution of the luminous flux

FLUX
LIGHTING

U.L.O.R. (Upward Light Output Ratio) Ratio of the upward luminous flux of the luminaire, measured under specified conditions with its own lamp(s) and equipment, to the sum of the individual luminous fluxes of the same lamp(s) when operated outside the luminaire with the same equipment, under specified practical conditions.

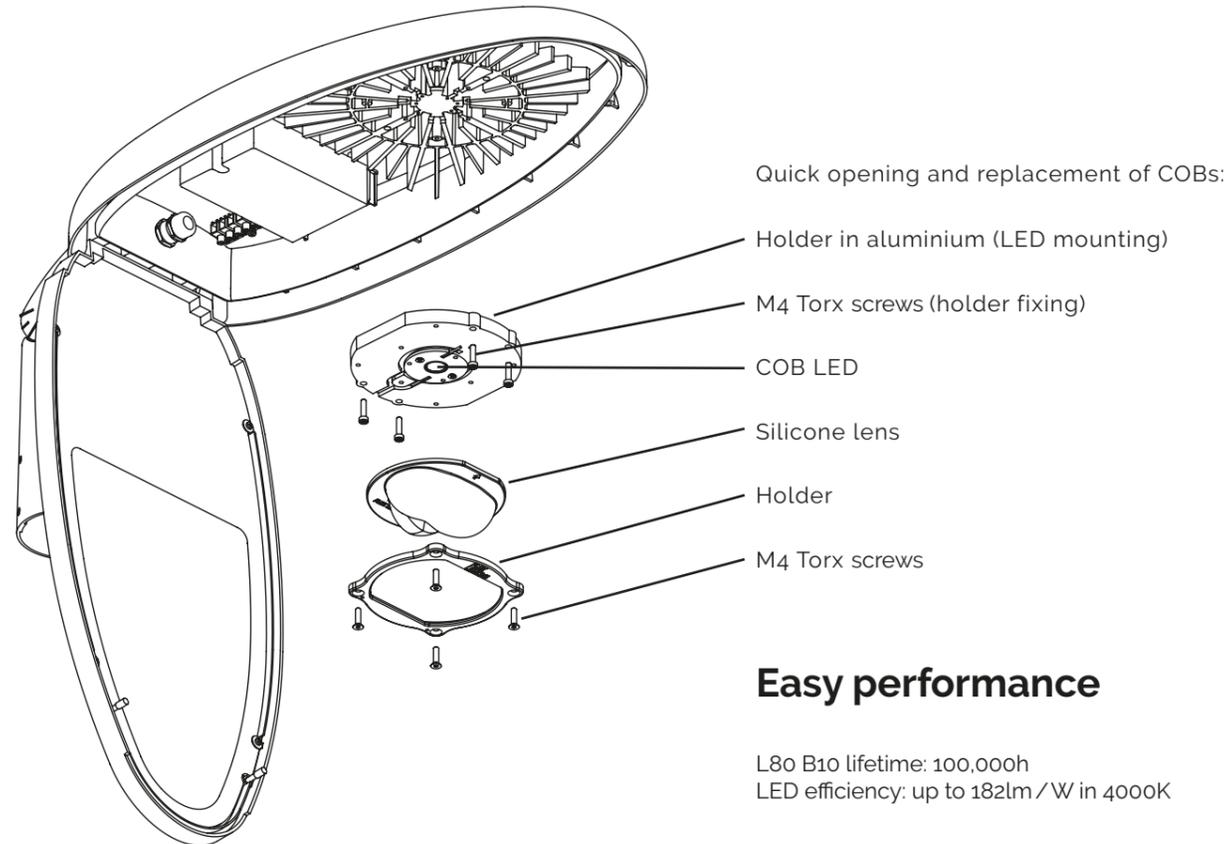

D.L.O.R. (Downward Light Output Ratio) Ratio of the downward luminous flux of a luminaire, measured under specified practical conditions with its own lamps and equipment, to the sum of the individual luminous fluxes of the same lamps when operated outside the luminaire with the same equipment, under specified conditions.

L.O.R. (Light Output Ratio) Ratio of the total luminous flux of the luminaire, measured under specified practical conditions with its own lamp(s) and equipment, to the sum of the individual luminous fluxes of the same lamp(s) when operated outside the luminaire with the same equipment, under specified conditions.

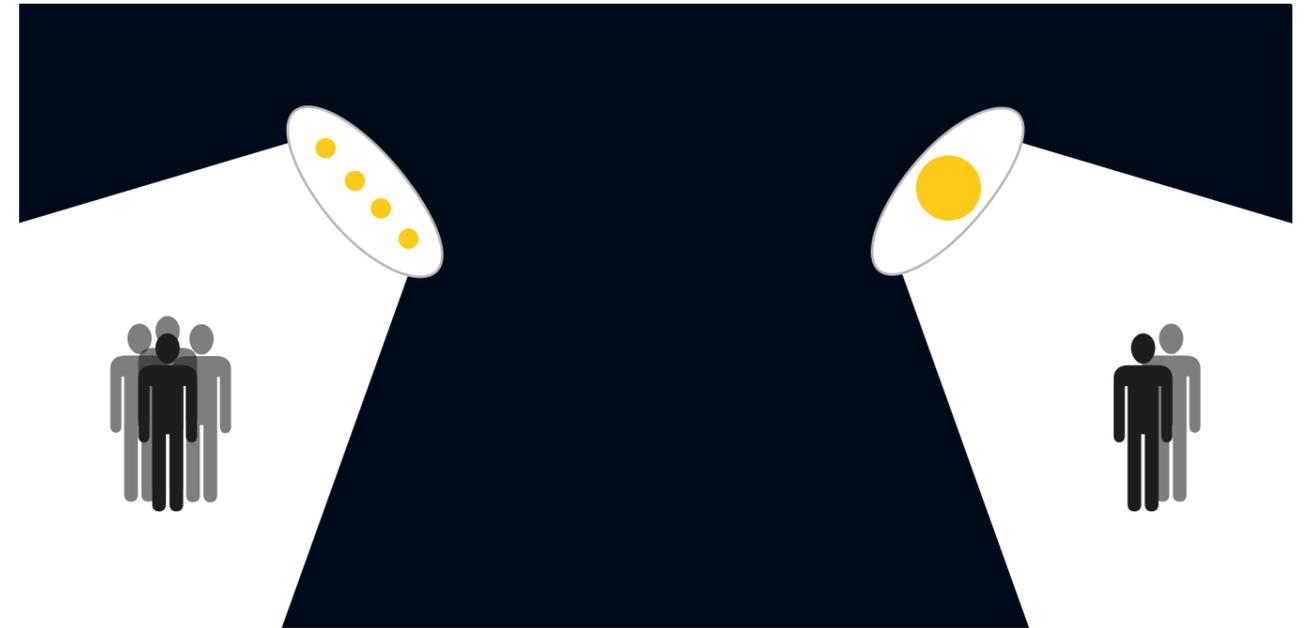

Easy maintenance

Standardized components, non-proprietary technology,
multiple suppliers = lower costs

The choice of COB technology

FLUX
LIGHTING

COB technology

COB (Chip-on-Board) – semiconductors are fixed directly on the substrate (support material). With this process, a “component density” many times higher than with SMD (surface mounted device) technology can be achieved. The huge technical advantage of COB modules lies in the uniformity of the emitted beam. The emission cone is uniform and has no distinct luminous points.

COB modules feature a large number of benefits. With L80/B10, after 100,000 hours, 80% of the initial luminous flux is achieved and only 10% of the modules fall below the L80 level. This extreme behavioural stability alone generates savings in the design of lighting installations because the failure rate and the ageing factor are almost negligible.

Light emission

Due to the uniform emission of the beam with COB technology, there are no luminous points or multiple shadows (multi-shadowing). The edges are sharp.

Puce

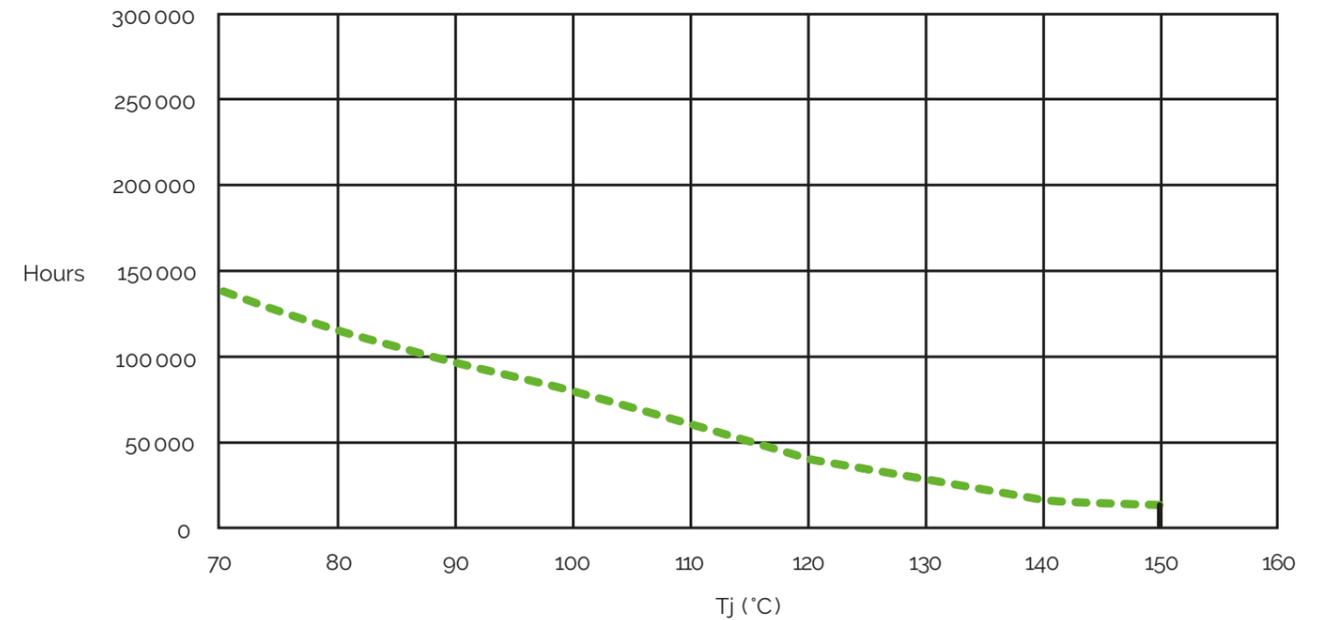

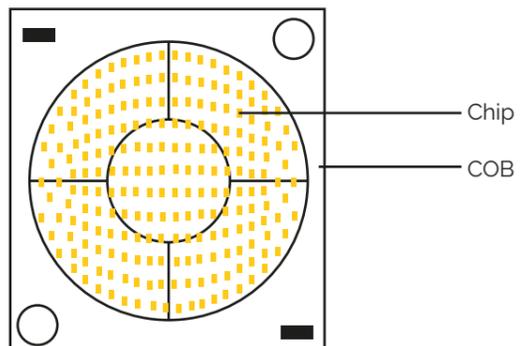

A COB consists of several lines of chips in parallel, 12 lines of 10 chips or 12 lines of 18 chips. When one chip dies the others continue to operate.

The circular distribution of chips allows for better heat dissipation and better optical rendering.

Proprietary lens

In silicone.

- Excellent transparency: High refractive index
- No yellowing
- High thermal resistance (-40° C to + 200° C)
- Waterproof
- IK10

COB L80 B10 lifetime

The lifetime of LEDs depends on 3 main parameters: The junction temperature, the current and the LED used.

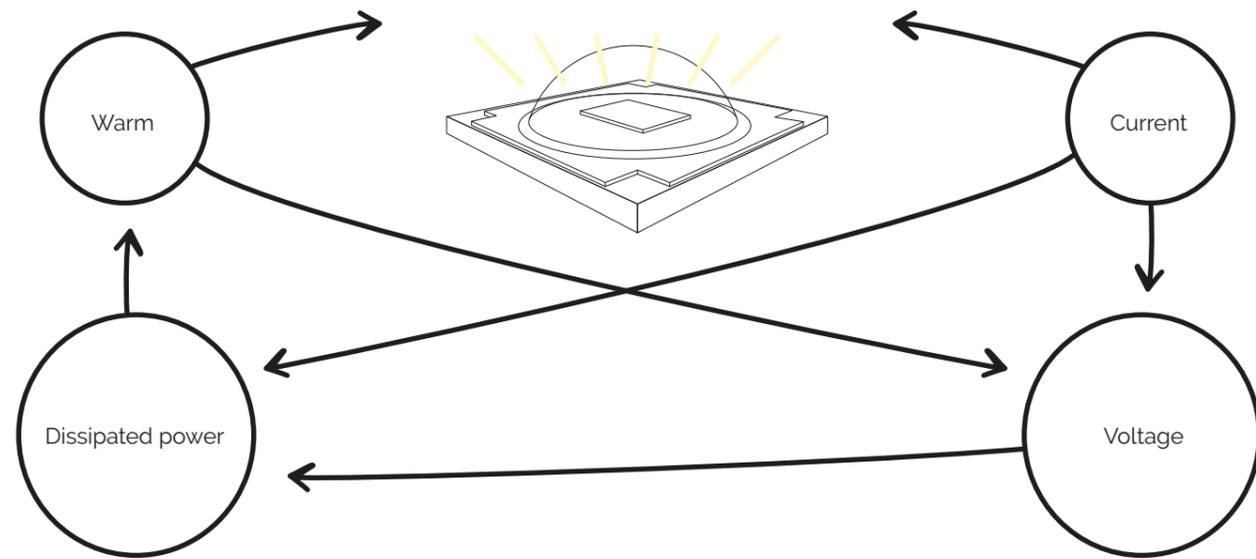

FLUX LED products are specifically designed to optimize heat exchange and have a maximum junction temperature of 85° C, well below 150° C (maximum Tj recommended by LED manufacturers).

We power the COB at 50% of the maximum current recommended by the manufacturer.

The lifetime according to the L80 B10 standard for COB is 100,000 hours at 80% of the remaining luminous flux, or 25 years for luminaires used in public lighting. Beyond this, the COBs will continue to operate.

The lifetime is specified for an ambient temperature (Ta) of 25° C. The average temperature in France at night is 7° C which improves longevity. The maximum permissible ambient temperature is 30° C.

We test the lifespans of COBs in our products under actual conditions to obtain actual values for longevity.

Heat dissipation

All luminaires designed by FLUX use LEDs. The design therefore incorporates passive heat sinks to dissipate heat from the LEDs, to reduce the Junction Temperature, so improving the service life.

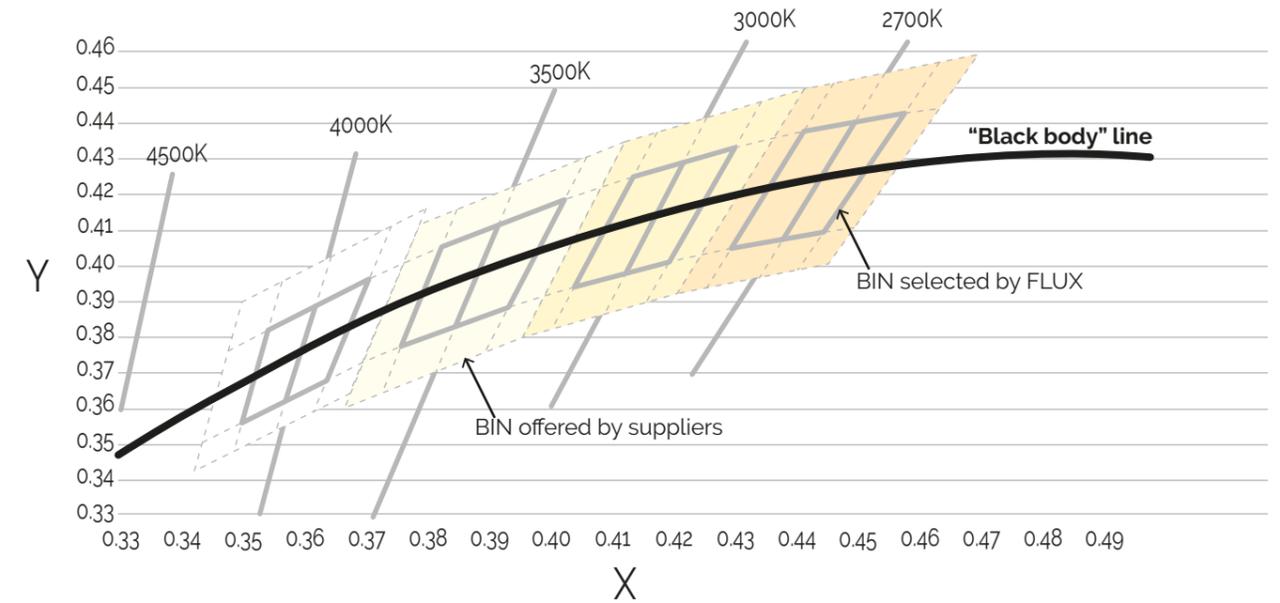

Standards

Standards for calculating the lifetime of an LED:

The LM80 standard measures the luminous flux of LEDs up to a maximum of 10,000 hours in real time. (The LM80 standard only tests drops in the luminous flux of the LEDs).

The TM21 standard extrapolates the luminous flux up to 6 times that of the LM80, i.e. 60,000 hr. maximum. (Standard developed by Cree, Osram, Philips Lumileds, Nichia, GE and two laboratories: PNNL and NIST, to provide a reliable computing system common to everyone).

L80 B10 is a statistical estimate of the lifetime of an LED such that 90% of the LEDs emit more than 80% of the initial flux.

LED Sorting

"BINNING" is sorting of LEDs to ensure the consistency of the colour and the quality of the light.

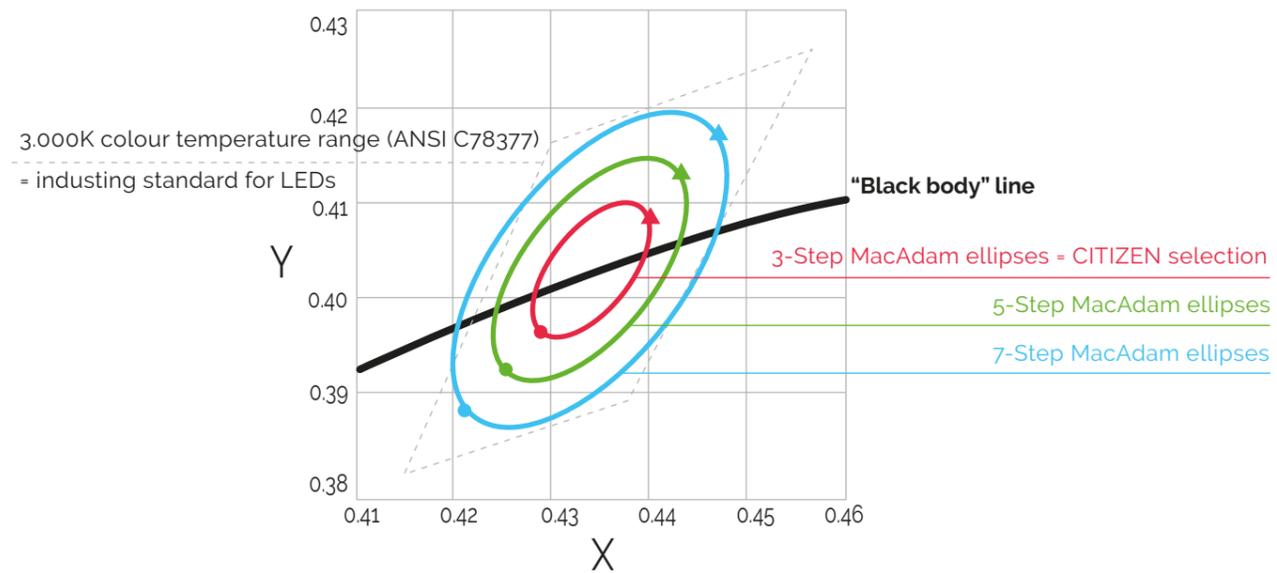

The sorting process is necessary because the human eye can detect minute differences in colour. Uniform chromaticity of light is essential in lighting.

To achieve this, our suppliers undertake to select a maximum of 4 BINs per shade of white (closest to the original curve), and for each order we manufacture our LED products with a single BIN.

Colour rendering index (CRI)

Colour rendering of light sources is important for the colour appearance of illuminated objects. We use LEDs with CRI 70 and higher.

Couleur des LED COB

Macadam Elipse

MacAdam ellipses are used to determine perceived colour differences. They are represented on the colour chart. Surfaces for which comparison colours around a given shade are perceived as being equally close. Up to a distance of 3 MacAdams, colour tolerances are barely detectable.

COB LEDs are measured in MacAdam ellipses and not in BIN.

We use 2 and 3 steps for our COB products.

Treatments

E.g. Delta Seal GZ® treatment of fasteners for corrosive environment for the last 2 years.

Standard treatments

Treatment of all our external stainless steel fasteners with Delta Seal GZ® protection (Teflon-based organic protective layer) provides outstanding corrosion resistance and galvanic isolation between metals.

Surtec 650 treatment (chrome-free) is used for primary anti-corrosion protection with secondary thermo-lacquering and a polyester powder coating.

All cast aluminium luminaires are anti-corrosion treated prior to polyester powder coating.

"Coastal" treatments

Standard treatment: castings are degreased, rinsed, washed and passivated before application of a coat of polyester powder coat.

"Coastal" treatment requires a standard treatment + the application of a layer of epoxy powder coat. under the polyester powder coat.

Connect system

Connect system for DMX / 230V

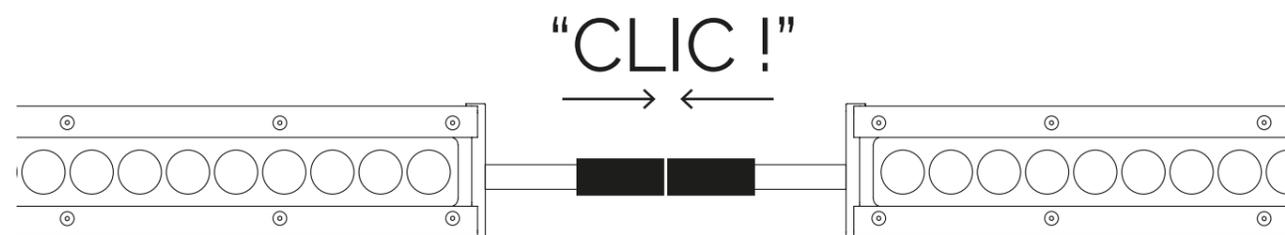

Wiring system with 230 V/DMX "snap-on" waterproof connectors, 100% reliable.
 Products affected: POWERFLOOD, X-LINE3, X-LINE4

Connect system for DMX / 24V

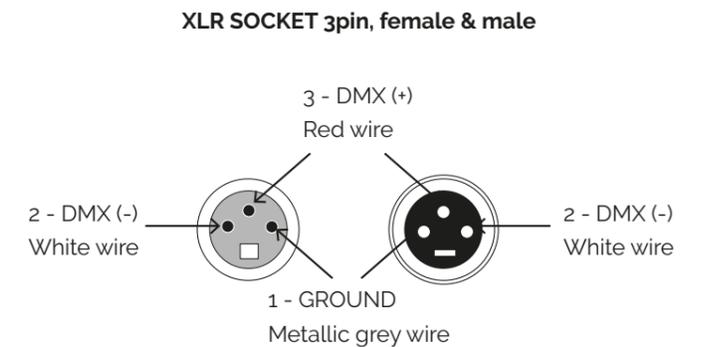

Wiring system with 24 V and 230 V "snap-on" waterproof connectors, 100% reliable.
 Products affected: X-LINE NANO 24V, X-LINE 3, X-LINE 4 and X-LINE UP² 230V.

Advantages

Connections are tight and allow for quick installation.
 The shape of the coupling system enables blind connection. In dark conditions, the keys enable easy connection procedures to avoid damage.
 FLUX has software that generates wiring diagrams which include all lighting required for installation.

DMX control

DMX protocol

Control protocol with the following characteristics:

- Control of a theoretical maximum of 512 channels.
- With a precision of 256 light levels per channel.
- A maximum of 25 devices per DMX line with a maximum length of 200 metres.
- Connections are made using DMX cables terminated with 3-pin XLR plugs with standardized wiring.

When you need to exceed the maximum number of devices (25) or the maximum cable length (200 m), a line SPLITTER can be used.

With a 4-way SPLITTER, you can connect 4 lines of 25 devices and add up to 200 m of DMX cable. A splitter is a repeater with several outputs. Each output can be independent.

In a project, it is important to consider the number of DMX channels shown for each device.
 Example: PILOTBOX LED RGB 700 mA uses 3 DMX channels.

More commonly known as a DMX plug, these ensure the proper circulation of DMX signals and prevent electromagnetic interference.

Addressing

PILOTBOX & POWER LED controllers are equipped with DIP SWITCHES which operate in binary mode. (Refer to the detailed combination tables in the technical manuals for each product to address them according to your choice).
 See addressing tables p.246 to 247.

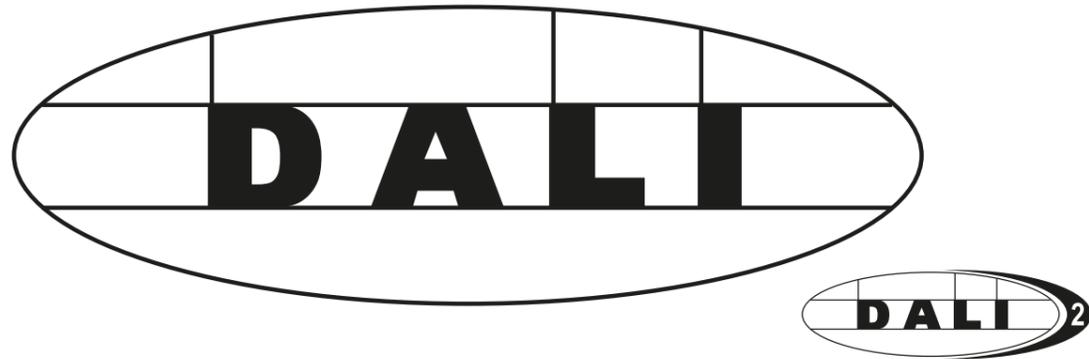

Pilotbox

Controller for dimmable LED range, available modes: DMX, DALI, push button, potentiometer, etc.

Recommendation

All DMX lines must be terminated.
 We strongly recommend (with over 200 m of DMX cable or on unused outputs of a Splitter) the use of 120 Ohm DMX terminating resistors at each end of the DMX line.

DALI control

DALI protocol

(Digital Addressable Lighting Interface)

The DALI protocol for controllers and luminaires provides optimal management of lighting via a bus (2-wire) called the DALI line. On, off and dimming are controlled via this line.

DALI addressing

The digital technology used by DALI (binary mode) lets you:

- Individually control 64 addressable luminaires that can be grouped together to form up to 16 groups.
- Precisely control the light intensity (gradation from 0.1% to 100% of the luminous flux on a logarithmic curve).
- Memorize 16 lighting scenarios (control and management scenarios). FLUX LIGHTING monochrome and RGB LED products use 3 channels, RGBW LED products use 4 channels, the pilot boxes use 3 channels, and the street luminaires use 1 channel in DALI.

DALI for public lighting

DALI drivers are available in our lanterns; DALI is usually used to connect to a centralised management system to benefit from feedback. With DALI v. 2, feedback can be obtained from multiple LED products.

DMX addressing in RDM

RDM

(Remote Device Management)

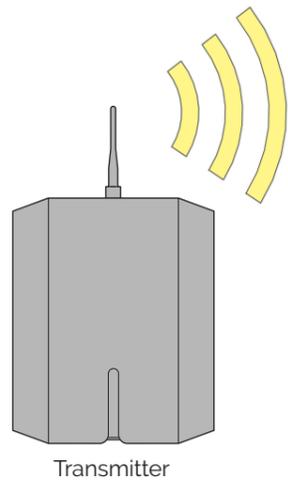

DMX512 is a unidirectional protocol. The flow of data goes in one direction only. Combined with RDM, the system becomes the bidirectional DMX512: requests to online devices, responses from the devices. Basic functions: setting of DMX addresses, modes and other configuration tasks.

The RDM protocol is a conversation. E.g.: the lighting console says: "Tell me your DMX address" and the device responds with: "My address is 032". This is called a "GET" command. The controller can then send a "SET" command, such as: "Set your DMX address to 065", and the device responds and recognizes this change. Using "GET & SET" commands and responses, the RDM protocol lets you modify and control the DMX system. The X-LINE³, X-LINE 4 DMX CONTROL, X-LINE UP² DMX CONTROL, POWERFLOOD 9 & 18 CUSTOM COLOURS and IP65 controllable power supplies use RDM technology.

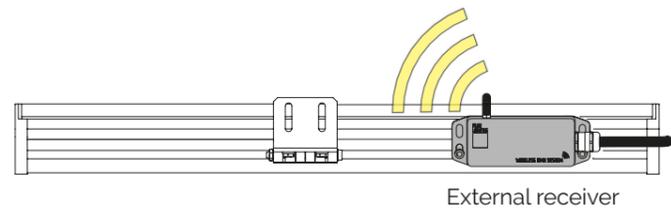

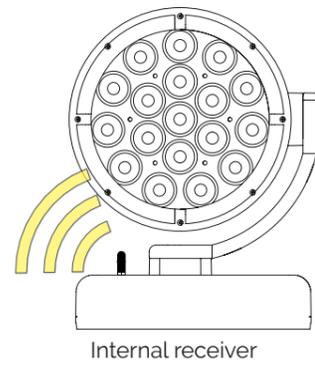

The ground (braid wire) must be connected in all DMX installations.

DMX Wireless System

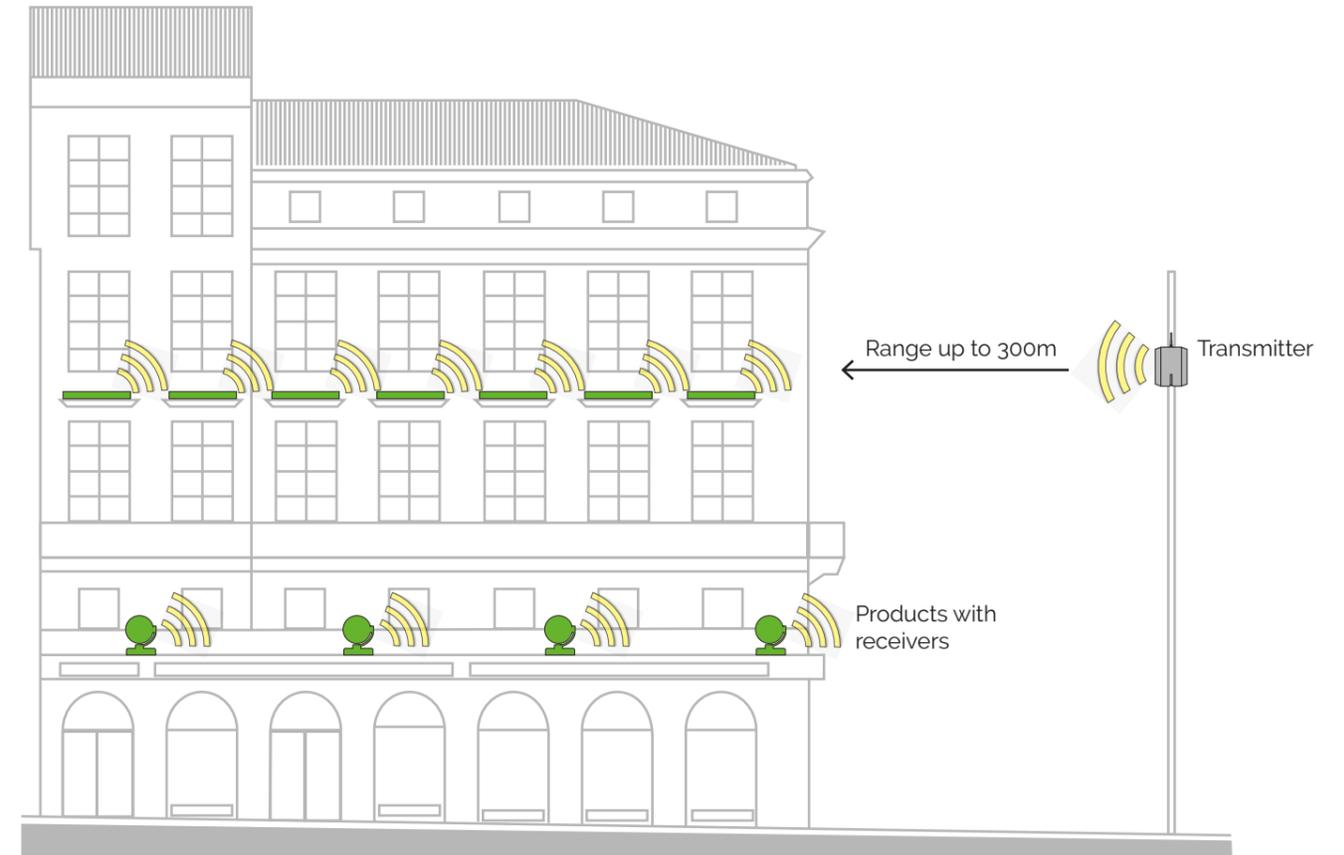

- DMX wireless control system:
- Simplified project design
 - Quick and cost-effective implementation
 - No cables = durability

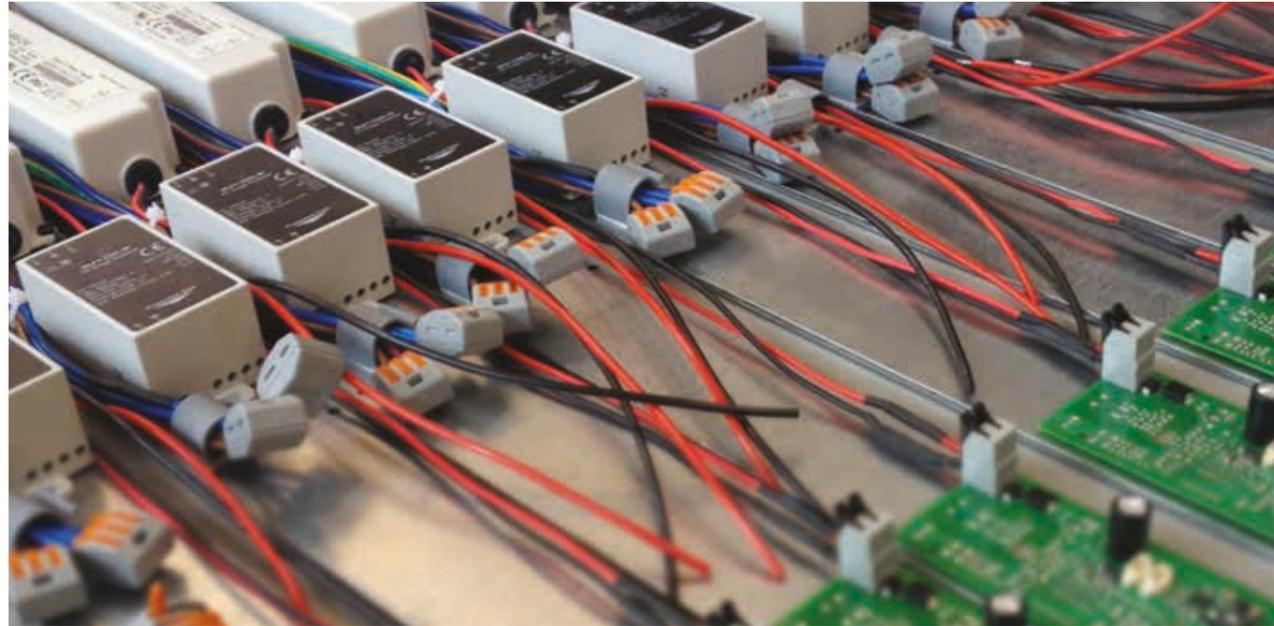

Wireless

Pilotage DMX Wireless System

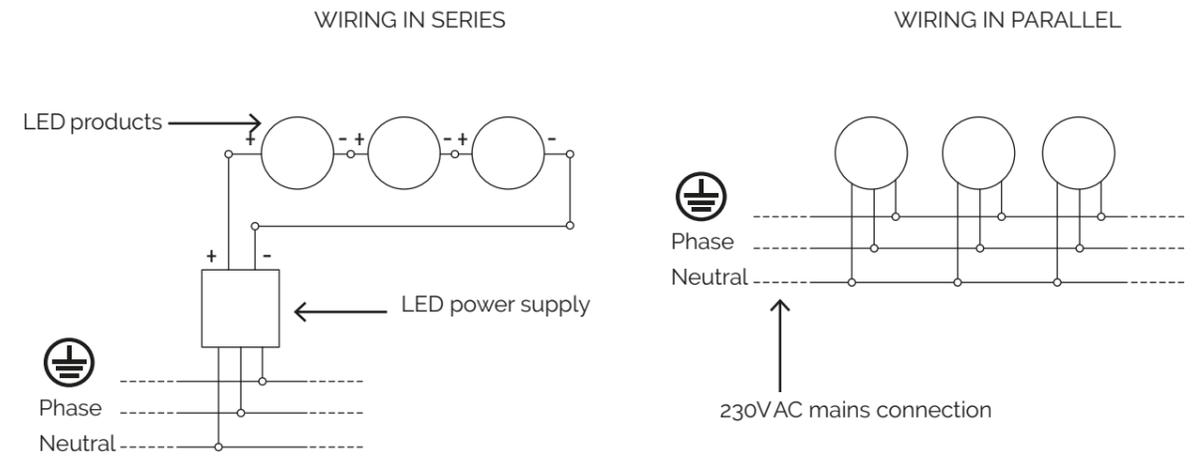

SPD

(Surge protection device)

LED lighting technology is used for its efficiency, energy savings and life expectancy.

However, LEDs are sensitive, like any electronic device, to transient surges and lightning, which is why all our LED systems, except lanterns, are equipped with surge protection to mitigate the risks relating to the installation.

Protection is integrated into all our luminaires or in our power supplies for luminaires with separate drivers, street luminaires are equipped with drivers with integrated protection.

Standards

Our luminaires comply with the European standard: EN 60598.

Connections

The connections must prevent tension on the cables. Allow enough cable length to remove the unit from its support.

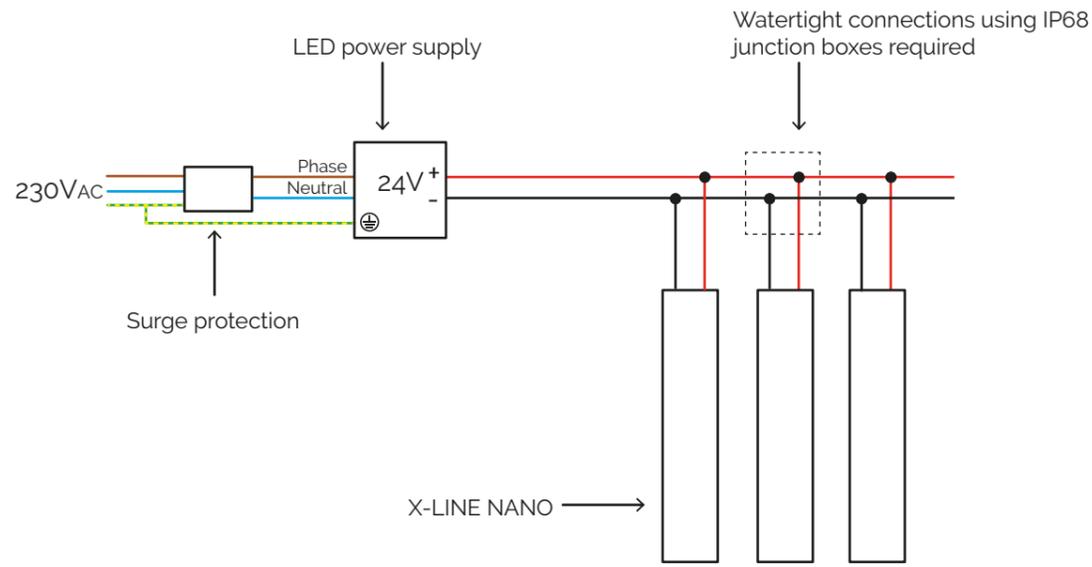

Parallel mounting:

When installed in parallel, each element is connected to the voltage source by a pair of wires (phase and neutral).

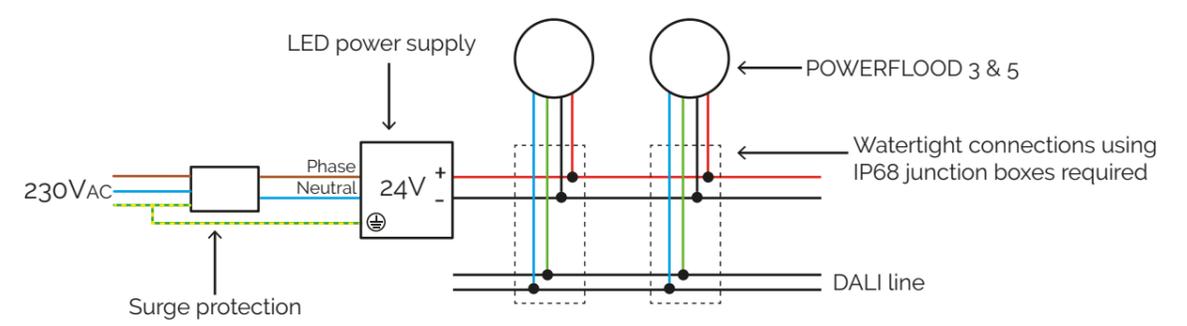

Installation in series:

When installed in series, the elements are chained together, only the first is connected to the voltage source (+), and the last (-).

Standards

C.E.

European conformity.

Low voltage directive

The Low Voltage Directive (2014/35/EU) aims to guarantee the safety of electrical equipment used in the voltage ranges 50 to 1000VAC (alternating current) and 75 to 1500VDC (direct current).

NF EN 60598-1

Luminaires - Part 1: General requirements and tests.

SELV

SELV: Safety Extra Low Voltage (50 V AC max and 120 V DC max.).

Directive européenne RoHS

The RoHS European Directive (2011/65/EU) aims to limit the use of six hazardous substances. "RoHS" means Restriction of the use of certain Hazardous Substances in Electrical and Electronic Equipment. The substances concerned are lead, mercury, cadmium, hexavalent chromium, polybrominated biphenyls (PBBs) and polybrominated diphenyl ethers (PBDEs).

Biometric photo security

IEC 62471, DIN EN 62471 (VDE 0837-471). This international standard, developed in Europe as part of the Low Voltage Safety Directive, describes how light sources, and therefore LEDs, LED modules and LED lighting, should be measured and evaluated.

Classification & index

ELECTRICAL EQUIPMENT CLASS

- CLASS I** Class I: the devices must be earthed for safety purposes. In the event of a fault, the current is cut off by a fuse.
- CLASS II** Class II: the devices have additional insulation in addition to functional insulation. In the event of a defect, accessible metal parts do not absorb unacceptably high voltages.
- CLASS III** Class III: devices are designed for very low voltages. They are powered at voltages below 50 V. Only for connection to safety transformers in accordance with EN 61558/VDE 0570, EN 61347/VDE 712 or VDE 0100 Part 410.

IP CLASSIFICATION

The IP rating indicates the degree of protection of a device against penetration of solid bodies (1st digit) and against penetration of water (2nd digit).

- IP1X Protection against solid bodies with Ø greater than 50 mm.
- IP2X Protection against solid bodies with Ø greater than 12 mm.
- IP3X Protection against solid bodies with Ø greater than 2.5 mm.
- IP4X Protection against solid bodies with Ø greater than 1 mm.
- IP5X Protection against solid bodies and dust.
- IP6X Total protection against dust.
- IPX1 Protection against vertical falling water.
- IPX2 Protection against vertical falling water with a maximum inclination of 15°.
- IPX3 Protection against rain up to an angle of up to 60°.
- IPX4 Protection against splashing water.
- IPX5 Protection against water jets.
- IPX6 Protection against splashing water similar to wave impacts.
- IPX7 Protection against the effects of immersion at 1 m for 30 mins.
- IPX8 Protection against the effects of prolonged immersion.

The combination of the two digits defines the IP rating of the luminaire.

IK CLASSIFICATION

The two figures of the IK index indicate the degree of protection against shocks. The table below shows the equivalences between the values in Joules and the corresponding IK index.

IK02	0.2 J or 0.2 kg, dropped from a height of 10 cm
IK08	5 J or 1.7 kg, dropped from a height of 29.5 cm
IK10	20 J or 5 kg, dropped from a height of 40 cm.
